

Maintaining and Updating Your Single-File Website

Update content with a text editor:

- Locate text and JSX elements in index.html
- Carefully edit within tags and className attributes
- Save and re-upload to your hosting

Update images by replacing files in /assets/images/ and confirming src paths.

Tailwind styling is editable inline via className attributes. For complex updates, React/JS knowledge is required.

Support is included post-launch for guided updates and troubleshooting.
